

ISRA VISION - PARTNER FOR THE PACKAGING, FILM & PRINTING INDUSTRY.

THE WHOLE WEB AT A GLANCE: 100% PROCESS MONITORING FOR QUALITY PRODUCTS – UNPRINTED AND PRINTED

ISRA VISION presents its portfolio of products for 100% optical in-line inspection of packaging, plastics film and premium printed products. ISRA's systems handle a wide variety of substrates and materials such as film, paper, cardboard and metal – all the way up to flexible electronic circuits and RFID tags. The freely scalable systems can be implemented at any stage of the process.

Dedicated solutions provide 100% print inspection for sheet and roll printing to the inspection of blanks. ISRA systems enable 100% monitoring and documentation of the print quality for the entire print job, in-line as well as off-line. Efficient algorithms and innovative technology facilitate reliable recognition of all defects that can lower quality.

Additional functions furthermore provide not only comprehensive options for monitoring color, register variations or material distortion, but also for real-time web monitoring and PDF verification.

Because of its many years of experience with high performance inspection systems, ISRA VISION offers reliable inspection even at the highest speeds. These systems can reliably detect even the tiniest print or material defect – and do so while electronically compensating for web wandering, sheet and material distortion (Fan-out), all without mechanical intervention.

An integrated database saves the inspection results, thus providing comprehensive information for objective, complete documentation of the quality.

ISRA VISION is a leading supplier of machine vision systems with strategical focus on high-speed optical web inspection systems for plastic film, nonwovens, paper, and - of course - print industries. Our goal is to provide the entire production chain with standard solutions. Thousands of systems installed successfully confirm the benefit of many years of experience and technological competence.
